the  
Date*

**Cardioimmunology 2026** will showcase the latest breakthroughs redefining our understanding of cardiac disease through the lens of immunology. This conference will highlight cutting-edge discoveries in immune driven mechanisms of cardiac dysfunction, with a particular focus on inter-organ and inter-cellular communication that converge in the heart. Recent advances will be presented and pave the way for immune based biomarker discovery and emerging therapeutic immunomodulatory strategies. Cardioimmunology 2026 will bring together leading scientists and clinicians, fostering collaborations to transform the prevention and treatment of heart disease.

Topics:

1. Myocarditis
2. Intercellular communication in the heart
3. The metabolism and inflammation nexus in cardiac disease
4. Vascular dysfunction in heart disease
5. Interorgan crosstalk in heart inflammation
6. Translational and clinical cardioimmunology
